Introduction

Websites are the cornerstones of the internet: the vehicle to deliver content throughout the world wide web. In this course, we will learn about the front-end and back-end implementations needed in order to create a website; through this project, we will hopefully create a working web application - with functional UI and a running dynamic database - over the course of the semester.

Due to the coronavirus pandemic, our mobility is greatly hampered, as in-class sessions are temporarily suspended and meeting places are closed from doing business. In these trying times, we've decided to work through a fully online environment, using the version control system application Github to manage and constantly update our application build. For communication, we've decided to use the platforms Microsoft Team and Discord to keep track of the state of our build with each other and reach out to peers/mentors for valuable feedback.

Hopefully, through the proper use of these applications, the project will be continuously saved and practically accessible as to minimize the potential problems that may arise throughout the allotted project timeslot. Our GIT repository can be found here: <https://git.fhict.nl/I450080/s-cb04-s2-g5>

Website Description

Our website application is a movie review website aptly named "Moview.com". In this site, users can sign up to create and view reviews made by other users for various movies, ranging from recent releases to established classics. Distinctions that we've made from the many movie review websites are the assignment of "tags" for the users to interact with and assign to in their review, therefore replacing the conventional rating system.

Tags are the main feature of the website, where movies are "tagged" based on the user's general evaluation of the movie's atmosphere and mood, as well as creating a content warning for the things that transpire during the movie. Example of the tags that can be used are: "Emotional", "Creepy", "Jumpscare-Warning", "Animal-Abuse", "Family-Friendly". Through the use of these tags, people that haven't seen the movie can hopefully receive a quick impression of the contents of the movie, and can easily decide for themselves whether it is something that they would watch. Tags can also be accessed and searched in the site to show the list of movies that contain those tags, as to find potential movies to watch based on the mood of the user.

Reviewers are then expected to write spoiler-free reviews that are meant to justify/explain why they assign a particular set of tags for the movie in greater detail, as well as their general impressions of the movie itself. Users can also choose not to write a review, but merely to assign tags, where the top 5 tags with the most assignments will serve as a general consensus of the user's impression on the movie and will be highlighted. We have decided to not implement a conventional rating system (5 stars/ 0-10 system) so reviewers can have a more nuanced and creative take in evaluating movies through the tag system, and site visitors are more encouraged to receive quick assessment and impression of the movie through the tags rather than through a generally more rigid rating system.

Website Layout

As for the layout of the website, the contents are:

1. Home / Landing Page : The first page visitors will arrive on when accessing the domain. It contains featured reviews for both recently released movies and old established movies. Clicking on a featured review will land users into the Review page of that particular movie.
2. Genre Page: The page where movies are sorted by genre. Clicking on a movie will land users into the Movie page of that particular movie.
3. Tags Page: The page where movies are sorted by tags that are separated alphabetically with an indexing system. Clicking on a movie will land users into the Movie page of that particular movie.
4. Recent Page: The page where recently released movies are shown and highlighted. Clicking on a movie will land users into the Movie page of that particular movie.
5. Movie Page: The page where a movie's full information are shown (Staff info, Genre, Synopsis, Running time, and the general consensus of Tags assigned by users), as well as a list of the reviews made by different users for this specific movie. Users that have signed up can also assign tags and create optional reviews.
6. Review Page: The page where a user's assigned movie tags and full review are shown for a specific movie.
7. Sign-Up/Sign-In page: The page where users can sign up to fully engage in assigning tags and creating reviews for a movie, as well as signing in if they have already signed up.

Viewports supported will be : width, initial-scale, user-scalable. This ensures responsive website design that will be scalable with the browser window, as well as allowing for improved accessibility by allowing users to scale the window by themselves (especially on mobile version).

Here are some examples of the wireframes for Moview:
